

Tuberculosis, diabetes y la tercera edad

Blanca I Restrepo, Ph.D.

Associate Professor of Epidemiology (EHGES Division)
University of Texas Health Houston, School of Public Health
Brownsville Regional Campus, Brownsville, Texas

&

Adjoint Associate Professor, South Texas Diabetes and Obesity Institute
University of Texas Rio Grande Valley, Edinburg, Texas

Marzo 25, 2021

WEBINAR

Tuberculosis y comorbilidades
¿problema de salud pública?

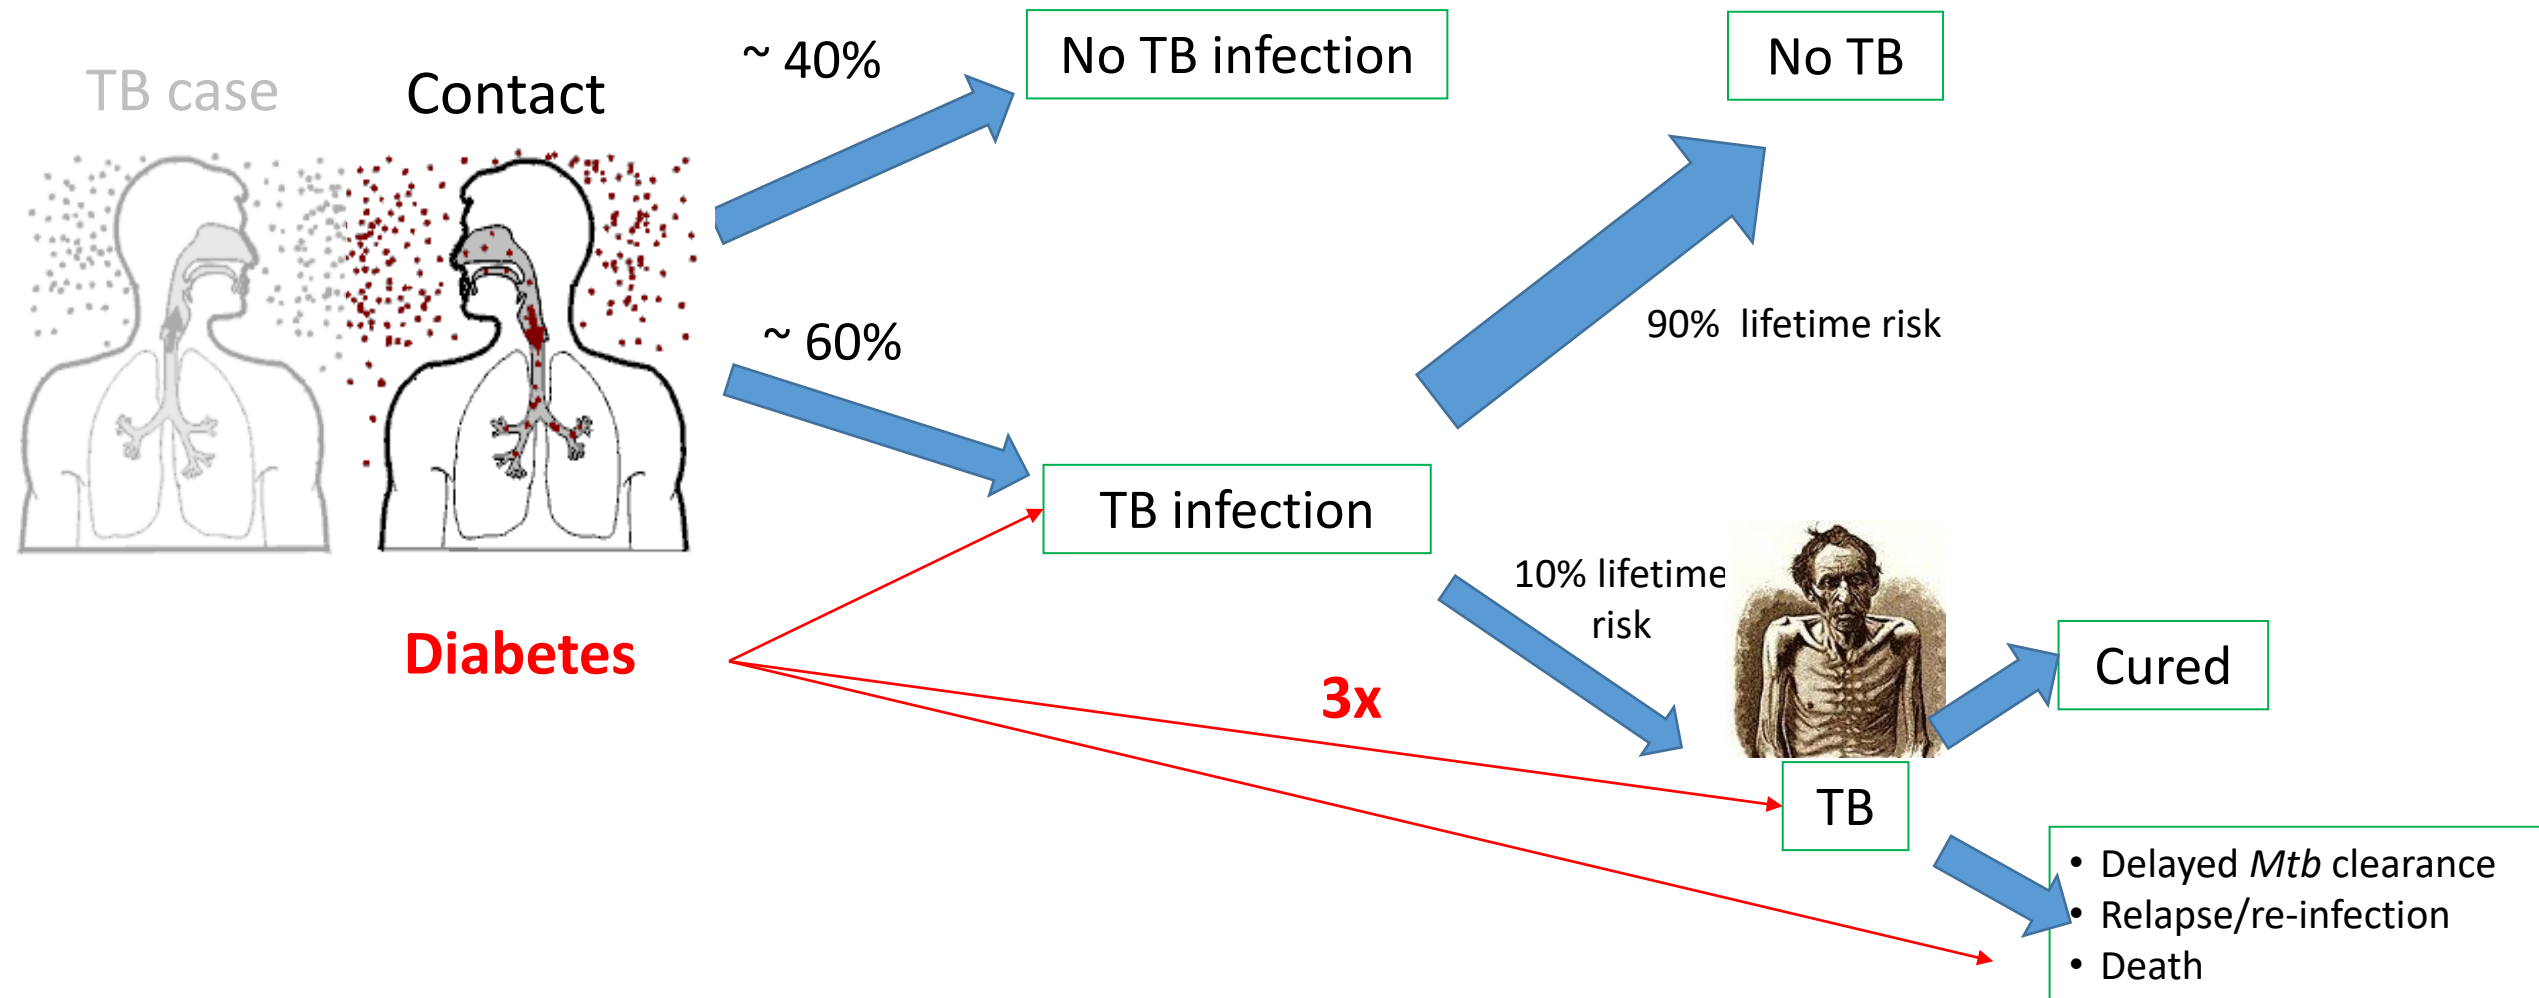

ORGANISMO ANDINO DE SALUD
CONVENIO HIPÓLITO UNANUE

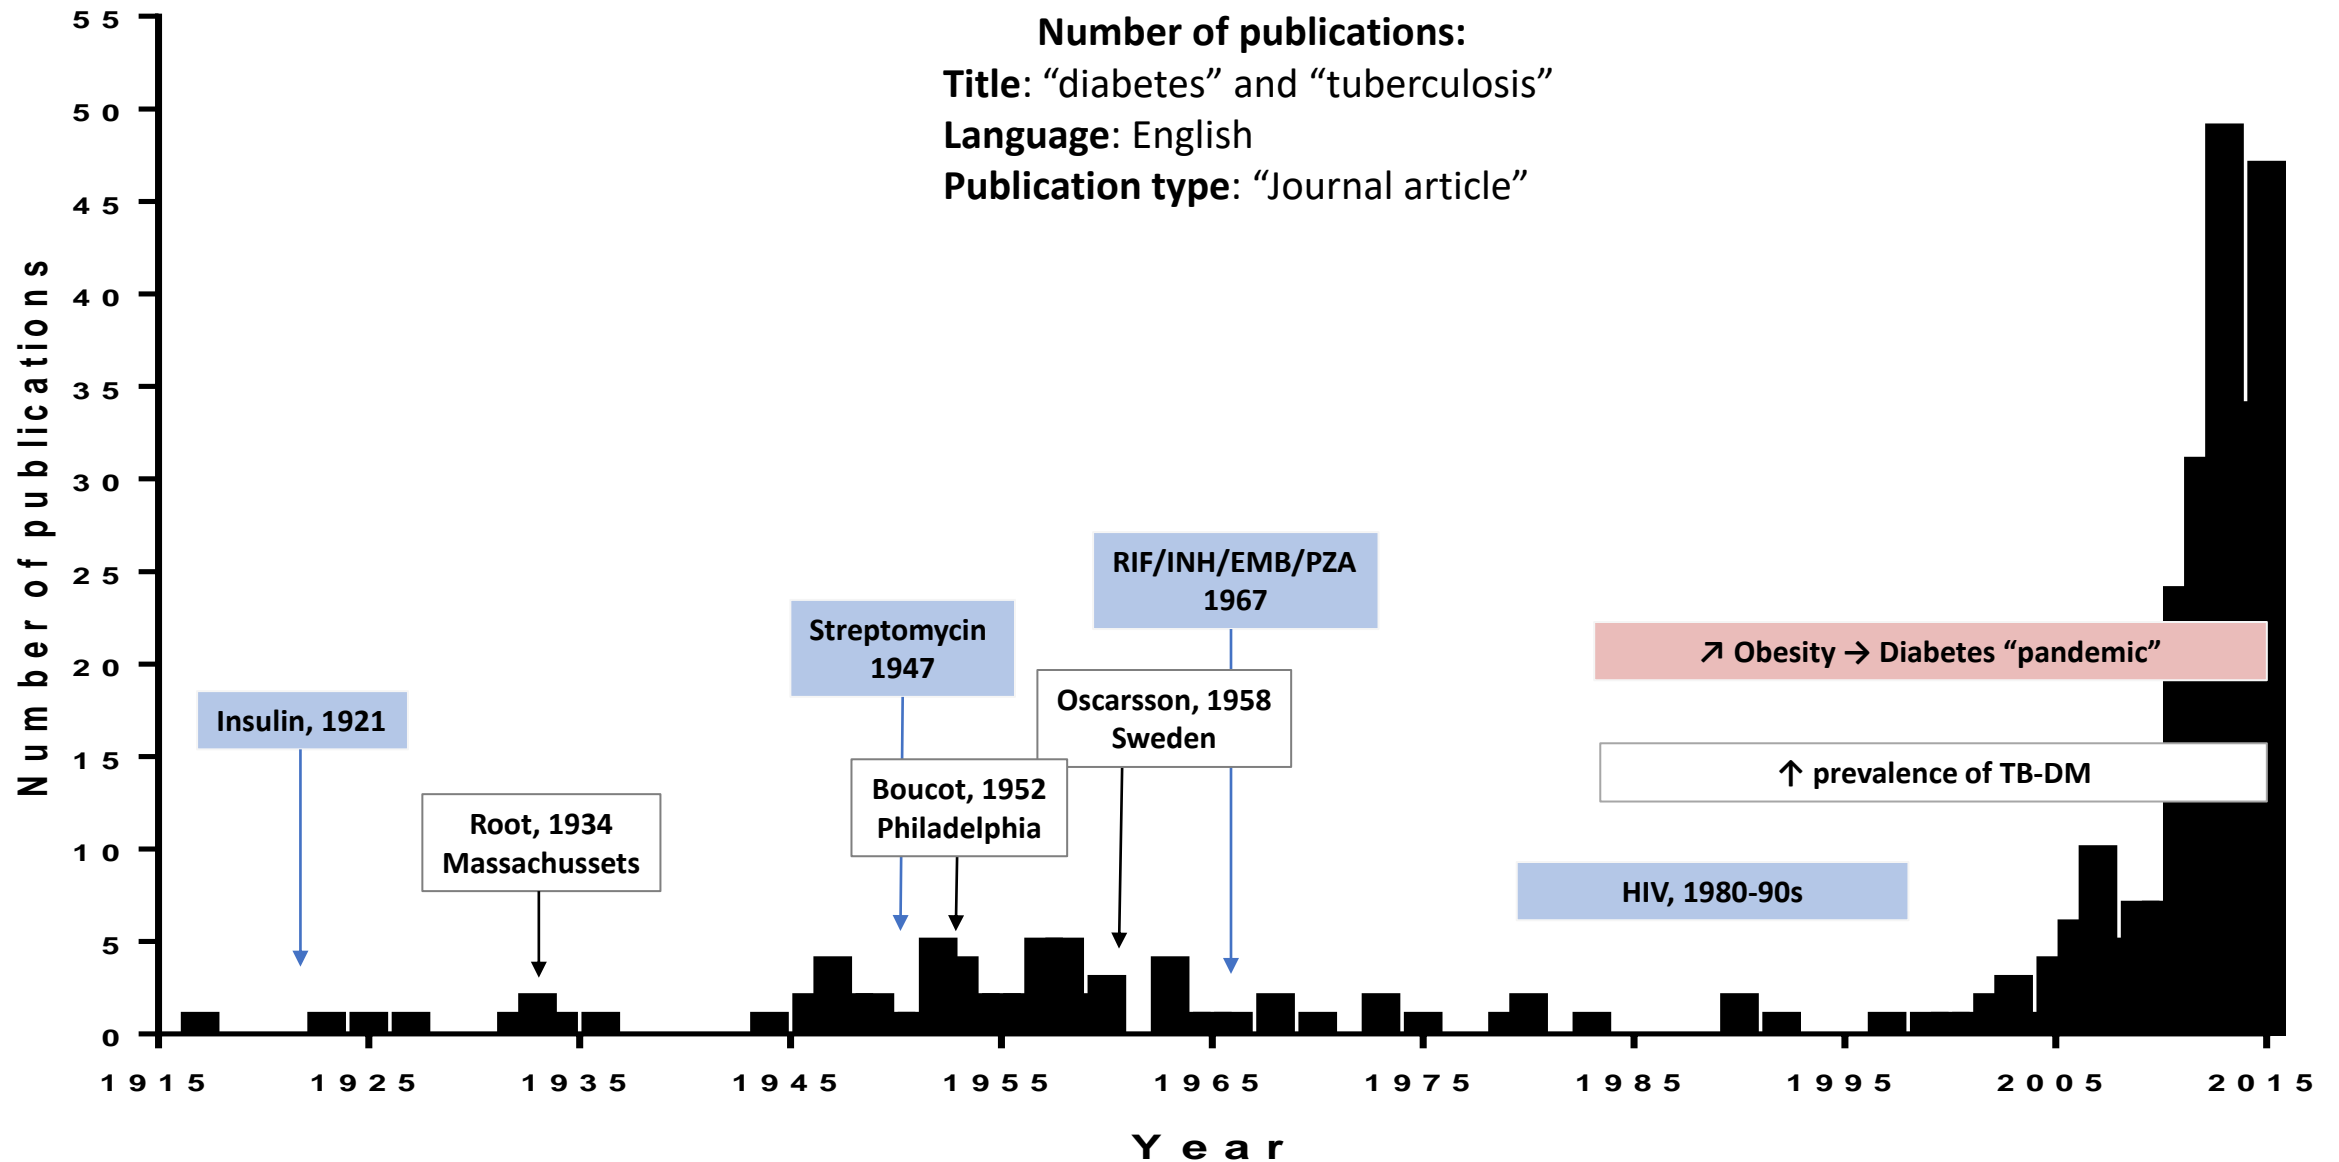

Seminar structure

- **Tuberculosis (TB) and diabetes mellitus (DM)**
 - Introduction: DM as a re-emerging risk factor for TB
 - TB-DM epidemiology: Our findings
 - Public health implications
- **TB in the elderly**
 - Why study the elderly?
 - Preliminary observations
 - Clinical implications

Association between TB and DM

DM: a re-emerging risk for TB

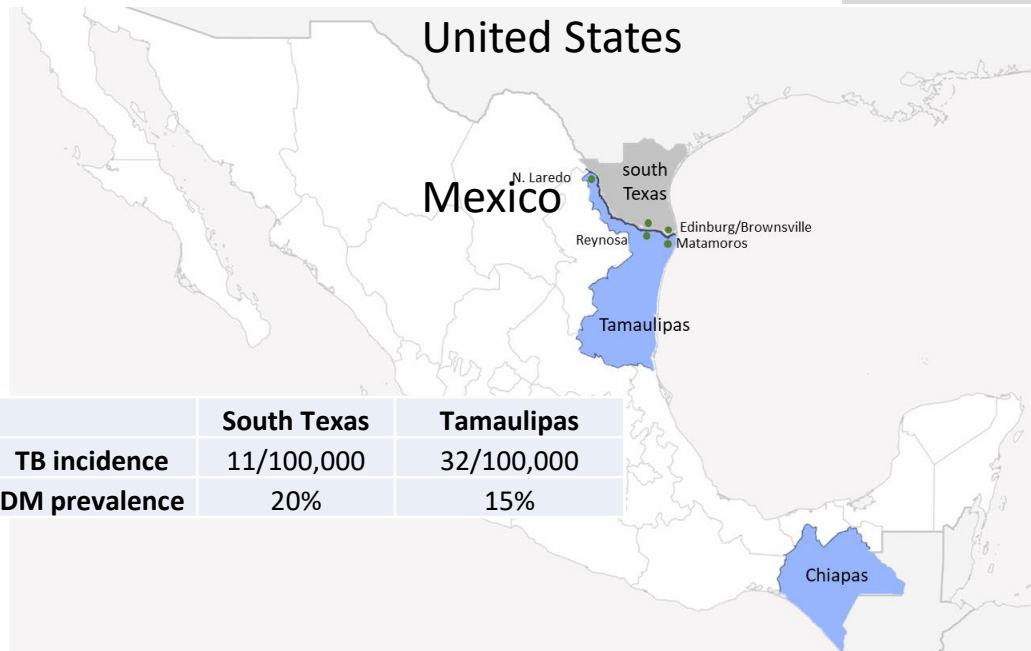

Overlap of TB and diabetes

80% of diabetes cases occur in low and middle income countries (LMIC)

Study sites and designs

| Retrospective epidemiology studies (TB surveillance datasets) | | | | | | |
|---|-------|----------|----------|-----------|-------------|---|
| Study site | n | | | | Years | Reference |
| | | Controls | Contacts | Active TB | | |
| S. Texas, USA | 1,441 | | | | 1996 - 2002 | Restrepo et al, 2006; Fisher-Hoch et al, 2008; Restrepo et al, 2008 |
| Tamaulipas, Mx | 3935 | | | | 1998 - 2003 | Restrepo et al, 2006 |
| Tamaulipas, Mx | 8,431 | | | | 2005 - 2013 | Abdelbary et al, 2016; Abdelbary et al, 2017 |
| Chiapas, Mx | 5,508 | | | | 2010 - 2014 | Raskak et al, 2019 |

| Prospective epidemiology studies | | | | | | |
|---|---------|--|--|--|-------------|--|
| Texas - Tamaulipas border | 233 | | | | 2006-2010 | Restrepo et al, 2008; Fisher-Hoch et al, 2010; Restrepo et al, 2011; Walsh et al, 2011 |
| Texas - Tamaulipas border vs South Africa | 106, 95 | | | | 2016 - 2018 | Restrepo et al, 2018 |
| Texas - Tamaulipas border | 657 | | | | 2016-2021 | <i>in preparation</i> |

Results: Diabetes prevalence in the Texas-Mexico border

DM definition in our studies:

- American Diabetes Association (2010 – 2018)
- 98% Type 2 DM

Confirmed DM (2006-2010)

¹ US-Mexico border diabetes prevention and control program, PAHO report;

² Cameron County Hispanic Cohort for south Texas (Fisher-Hoch et al, 2010)

Conclusions:

Prevalence: Significantly higher among TB patients when compared to community controls ($p \leq 0.05$)

Odds ratio ~ Relative risk of TB in DM patients

Texas: 3.0 (2.3 – 4.2)

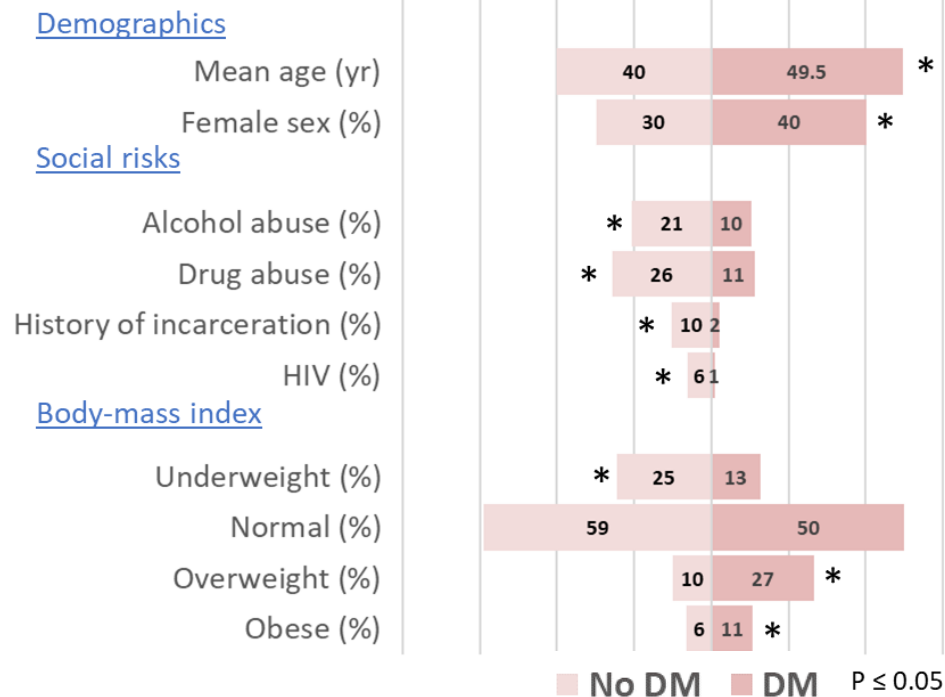

Mexico: 2.7 (1.6 – 4.4)

Population attributable risk of TB due to diabetes (PAR%)

Profile of the TB-DM patientvs TB-no DM

Socio-demographic characteristics:

History of DM:

Diabetes awareness and history (TB patients, 2006-2010)

| | Texas (n=27) | Mexico (n=79) | Total (n=106) |
|----------------------------------|--------------------|-------------------|-------------------|
| n with DM | 11 | 27 | 38 |
| Self-reported, n (%) | 11 (100%) | 22 (81%) | 33 (87%) |
| Years with DM (in self-reported) | 12.3 (8.8) | 7.6 (7.6) | 8.9 (8.2) |

* DM using 2004 American Diabetes Association definition (no HbA_{1c})

TB characteristics at the time of TB diagnosis:

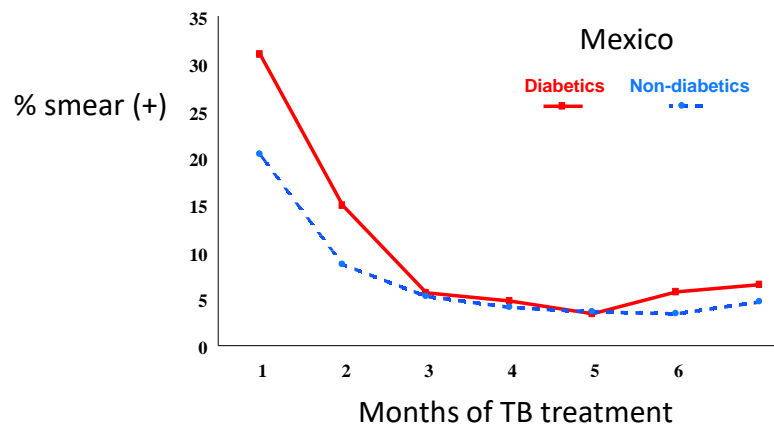

Conclusions:

- Female patient > 40 years old
- No “classical” profile for TB
- Chronic history of DM

THINK TB!! and a more contagious TB?

TB treatment outcomes

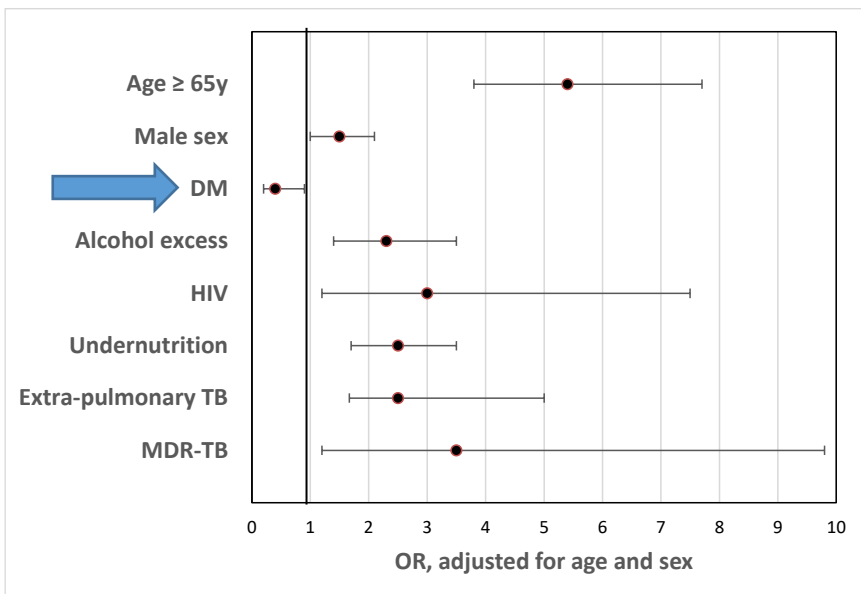

1. Mycobacterial clearance:

Restrepo et al, AJTMH, 2008

3. Death during TB treatment:

Host factors associated with death during TB treatment, Tamaulipas 2006-2013, AdjOR (sex, age*)

* Similar findings in TB patients from Chiapas, 2010-2014

Adapted from Abdelbary et al, Epidemiol Infect, 2017

2. Drug resistance:

| | Diabetes | No diabetes | p value | OR |
|-------------------------------|---------------|----------------|--------------|------------------------|
| Texas (1996-2002) | n=401 | n=1,041 | | |
| DR-TB | 41 (10.2%) | 98 (9.4%) | NS | |
| MDR-TB | 18 (4.5%) | 31 (3.0%) | 0.018 | 1.1 (1.1, 4.4)* |
| Tamaulipas (1998-2003) | n=343 | n=1,384 | | |
| DR-TB | 83 (24.2%) | 255 (18.4%) | 0.024 | 1.4 (1.1, 1.9)* |
| MDR-TB | 59 (17.2%) | 173 (12.5%) | 0.040 | 1.5 (1.0, 2.1)* |
| Tamaulipas (2006-2013) | n=2132 | n=6357 | | |
| DR-TB | 81 (3.8%) | 178 (2.8%) | 0.021 | 1.4 (1.1, 1.8) |
| MDR-TB | 20 (0.9%) | 35 (0.6%) | 0.055 | 1.7 (0.98, 3.0) |

* OR adjusted for age and sex; Fisher-Hoch et al, 2008; Abdelbary et al, 2016

4. Relapse and re-infections:

- Relapse OR 3.89 (2.43, 6.23) Baker et al, BMC Medicine, 2011 (Systematic review)
- Relapse aOR 1.96 (1.22, 3.15) Lee et al, PLoS One, 2014

Conclusion:

DM is associated with more adverse TB treatment outcomes

Public health implications.....

▶ TB clinics:

- ▶ Strategic site to screen for new DM
 - Among TB patients: Yes. (even in developed countries!)
 - Among TB contacts? Maybe
- ▶ Strategic site for joint management of TB and DM?
 - Maybe. At least during first phase of TB treatment?

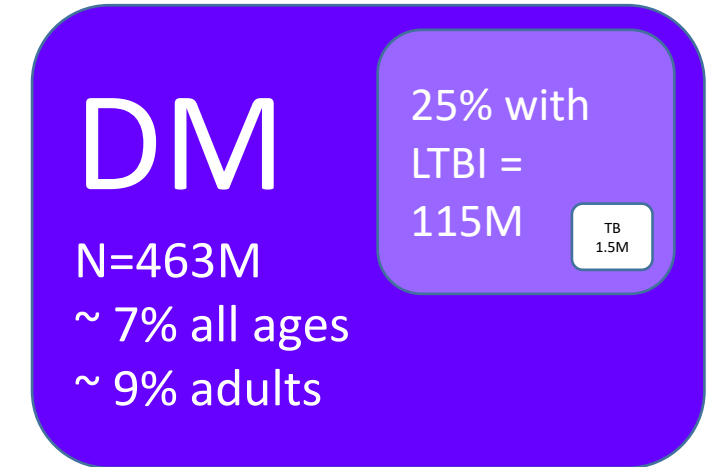

▶ DM clinics:

- ▶ Screen for Active TB. Per WHO guidelines
- ▶ Screen for LTBI?? Not per WHO guidelines.... If screen → LTBI+ → LTBI treatment
- ▶ Need more Information to stratify TB risk among diabetes patients....

▶ General clinics:

- ▶ Impact of COVID-19 and DM on TB?

| Among.... | Location | % new DM/DM ³ |
|---------------------------|----------|--------------------------|
| TB (20+ yrs) ¹ | Texas | 18% |
| | Mexico | 36% |

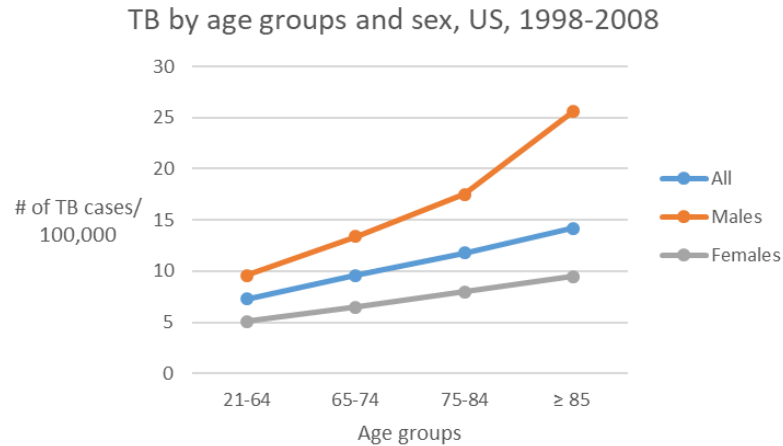

TB in the elderly

TB in the elderly

- Increasing age is a risk factor for **TB disease** (Hochberg, 2013)

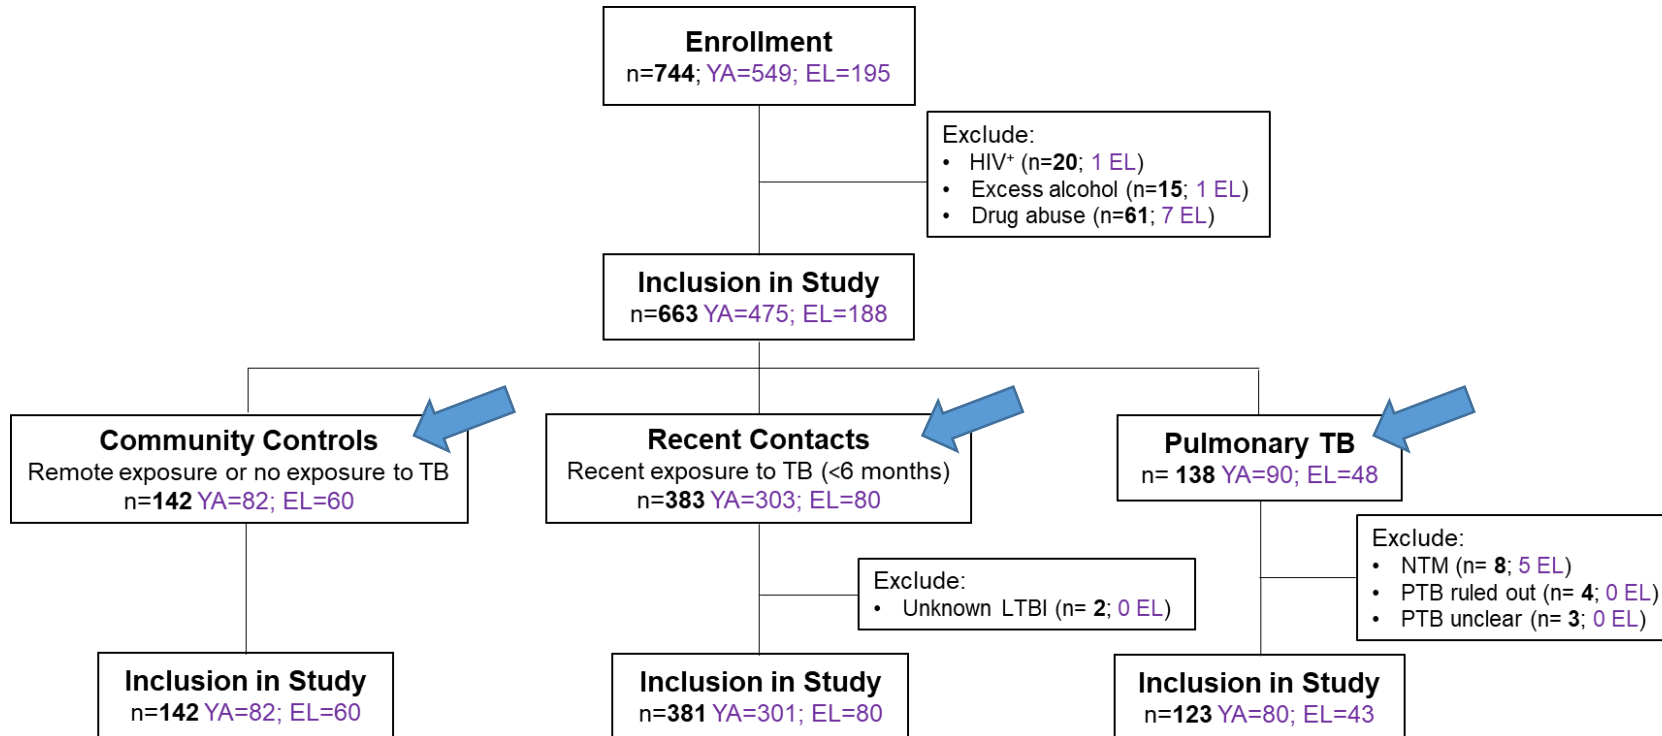

- Increasing age is a risk factor for **death from TB** (Hochberg, 2013)
 - 20-33%; 6-8 fold higher risk vs adults (Teale et al, 1993; Wang et al, 2008; Yen et al, 2017)
 - 50% from TB (Garcia-Goez et al, 2020)
- The global population is aging. It is estimated that the % of the global population $\geq 65y$ will be (US Census Bureau, 2016).
 - 2015: 8.5%
 - 2050: 17% 

Why are the elderly at higher risk of TB?

- Epidemiology
 - **Higher exposure** to TB as children (vs younger cohorts)
 - TB was more prevalent years ago
 - Larger reservoir for LTBI with risk of re-activation TB
 - **Higher risk of exposure** in long-term care facilities
- Biology
 - Higher risk of LTBI →→ TB
 - Compromised immunity
 - Co-morbidities (diabetes, renal failure, cancer)
 - Smoking, low BMI

Study in the elderly: TB, contacts and controls

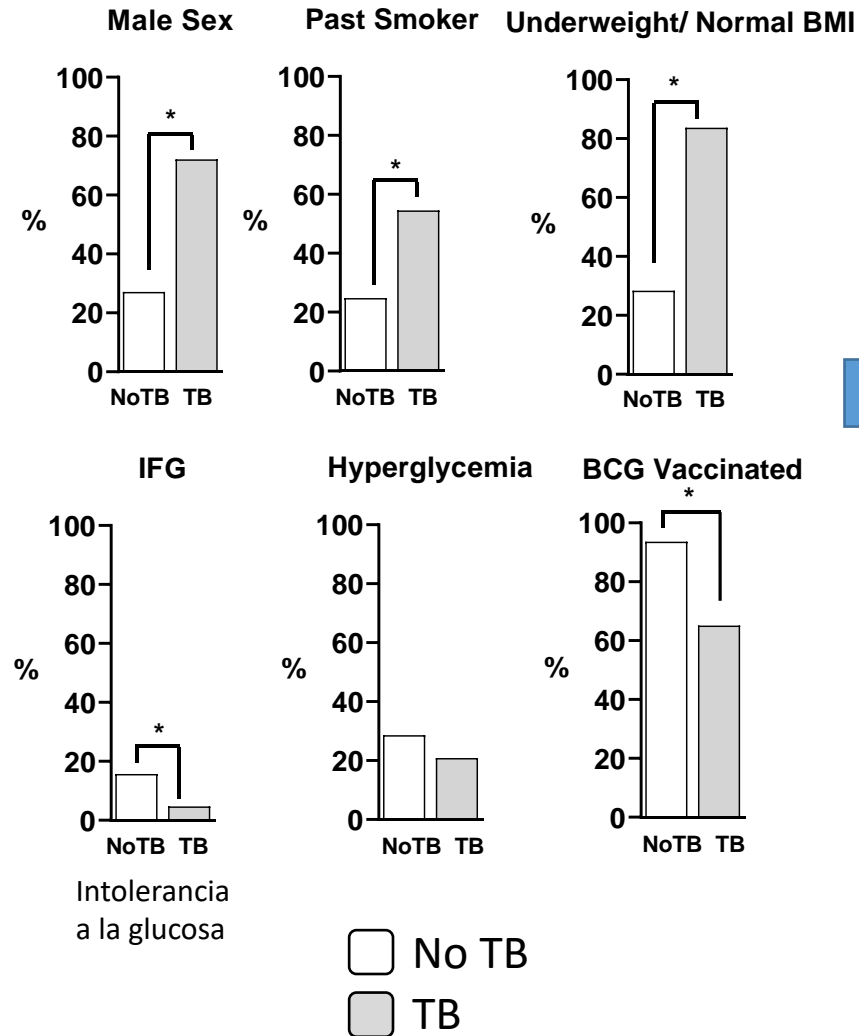

Elderly: 60+ years old

Young adults (YA): 18-50 years old

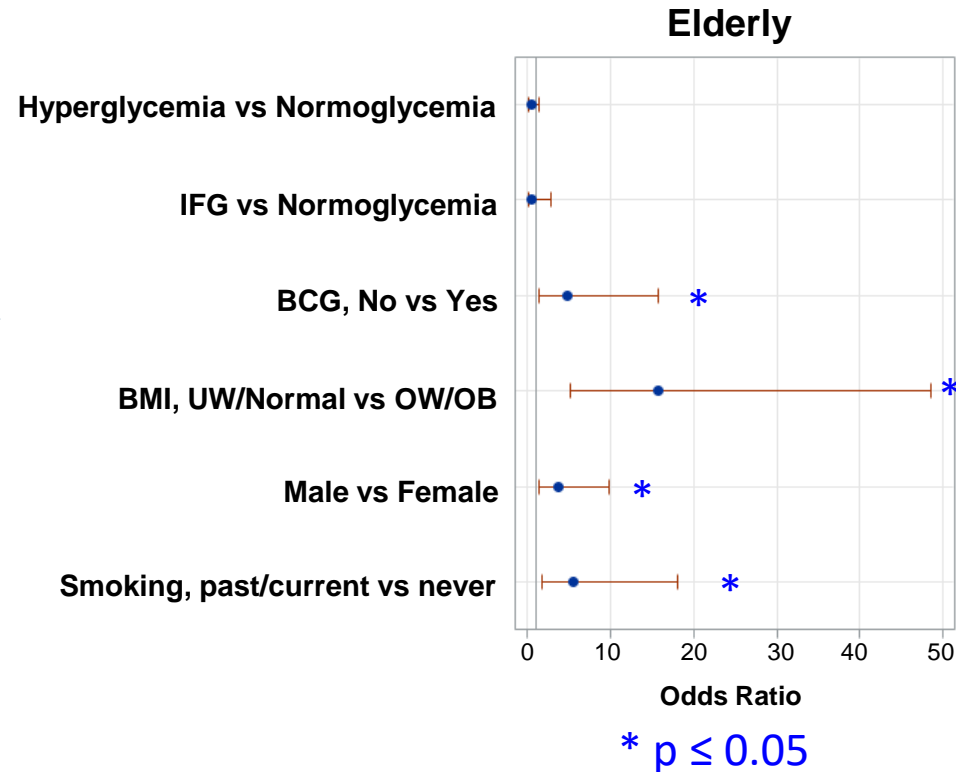

Identifying risk factors for TB among the elderly: TB vs no TB

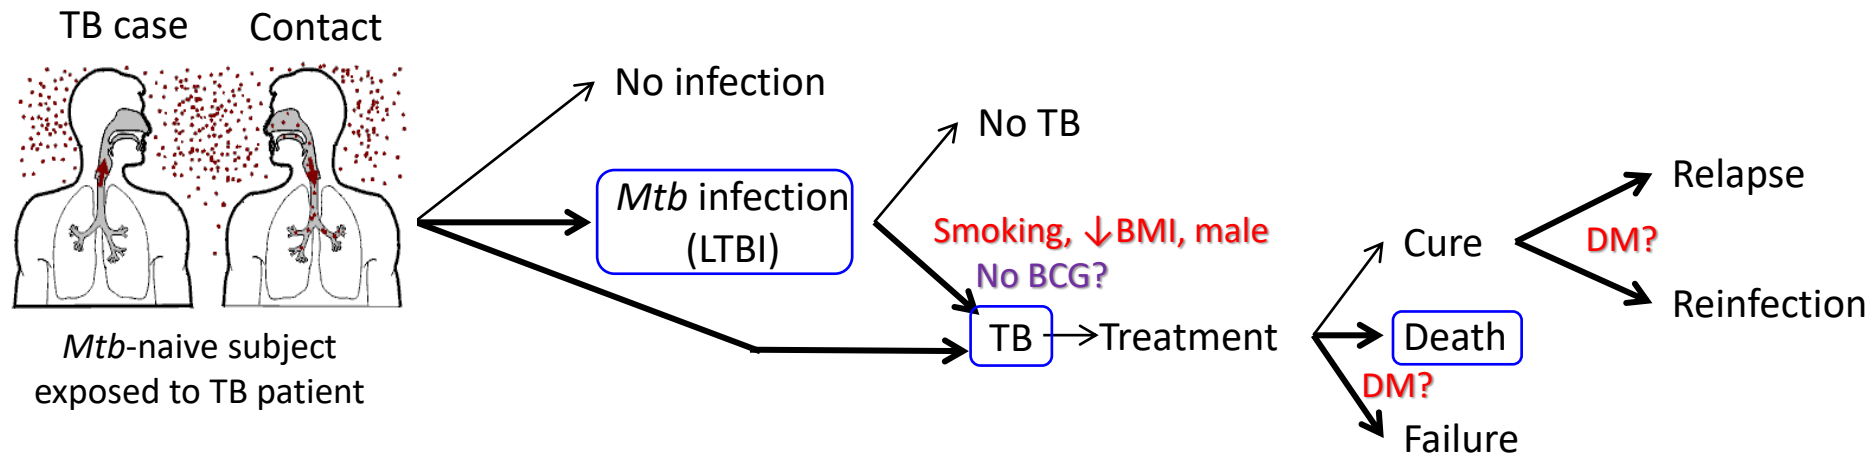

Univariable analysis among elderly +/- TB

Multivariable logistic regression analysis

Impact of host factors on the history of TB... in the elderly

Acknowledgments

Restrepo team
